### Overview:

Clinical correlations are increasingly emphasized in the teaching of basic medical science. Students, therefore, need exposure to clinical cases to pass course exams. This resource contains 52 clinical cases correlated to high-yield pharmacology concepts. Each case includes a very basic discussion related to key science concepts, definition of key terms, pharmacology pearls and USMLE style review questions. The authors attempt to provide the medical student with cases so that they can bridge their study of pharmacology to actual applications on the use of drugs in the treatment of clinical diseases
